

AVYUHA

15-Page Product Knowledge Base for RAG Practice

Designed for Naive RAG, Hybrid RAG, Agentic RAG and Multimodal RAG practice

AVYUHA is a fictional parent technology brand created for learning Retrieval-Augmented Generation. It brings together human connection, anonymous expression and accessible digital commerce under one shared identity.

Products in this knowledge base

- MutualDreamers - dream sharing and meaningful connection.
- Random Confession - safer anonymous expression.
- AVYUHA SaaS - digital tools for micro and small businesses.

Practice purpose

This PDF is not an official public company document. It is a structured learning file for testing retrieval, citations, exact-match search, refusal behavior, comparison questions and multi-step reasoning.

2. Parent Brand Overview

AVYUHA acts like a parent brand. It provides common vision, design standards, responsible AI principles and a shared product foundation while each product solves a different user problem.

Brand mission

The mission of AVYUHA is to build useful, inclusive and responsible digital experiences for people, communities and small businesses.

Product ecosystem

Product	Primary problem solved
MutualDreamers	Dreams disappear quickly and people lack a dedicated place to preserve and discuss them.
Random Confession	People need a space to express thoughts that feel difficult to share publicly.
AVYUHA SaaS	Small businesses need affordable tools for storefronts, catalogues, customers and operations.

Brand pillars

Pillar	Meaning
Human connection	Products should help people express, remember, discuss and connect.
Safe expression	Users should have privacy choices, reporting options and clear content boundaries.
Accessible commerce	Small businesses should get affordable digital tools without needing advanced technical knowledge.
Responsible AI	AI should support creativity and productivity without pretending to be medical, legal or financial advice.

3. MutualDreamers - Product Concept

MutualDreamers is an AVYUHA social product where users can preserve dreams, share them through text or voice and discover similar dream experiences from other people.

Why MutualDreamers exists

Most dreams disappear soon after waking, even though they may contain strong emotions, imagination and personal meaning. Existing social platforms focus mostly on real-life photos, achievements and public identity. MutualDreamers creates a dedicated space for inner experiences that people usually cannot show.

Core user value

Value	Description
Memory preservation	Users can save dream stories before they fade.
Emotional connection	Users can find people who felt similar dream emotions.
Creative inspiration	Dreams can become conversations, art ideas or AI-assisted visual concepts.
Dream twin discovery	Semantic matching can help users discover similar dreams.

4. MutualDreamers - Features and Safety

Core features

- Create dream posts with title, description, optional theme and optional voice note.
- Explore a dream feed and react using choices such as I felt this too.
- Build a Dreamer profile with display name, Dreamer ID, country and activity.
- Discover similar dreams or dream twins through semantic matching.
- Use future AI features for summaries, themes, safe suggestions and dream visualization.

Safety limits

Dream interpretation must be presented as creative reflection, not medical or psychological diagnosis. Sensitive content should include reporting, moderation and privacy choices.

Development team

Name	Role for practice document
Sujith	Frontend and product experience contributor.
Sai Charan Reddy	AI/RAG learning, product direction and deployment practice.
Varshitha	Community experience and safety contributor.
Shivani	Content flow and user experience contributor.

5. Random Confession - Product Concept

Random Confession is an AVYUHA community product where people can express personal truths, opinions and lived experiences without the pressure of presenting a perfect life.

What users can share

Category	Examples
Life experiences	Memories, lessons, failures, achievements, family situations and everyday moments.
Work experiences	IT job pressure, office culture, interviews, burnout, career confusion and workplace learning.
Relationships	Love, attraction, desire, regret, loneliness, friendship and emotional confusion.
Opinions	Personal views about society, education, career, technology or daily life.

Why it exists

Many people want to speak honestly but fear judgment, identity exposure or social pressure. Random Confession creates a structured place for expression while still requiring safety boundaries.

6. Random Confession - Moderation and Privacy

Privacy approach

Users may choose anonymous display names. The platform should avoid exposing personal details unless the user intentionally shares them. Confessions should not require real identity by default.

Moderation principles

- Do not allow targeted harassment, threats or doxxing.
- Use report and review flows for harmful content.
- Separate emotional confession from dangerous instruction.
- Give users control to delete or edit their own confessions.
- Avoid presenting AI responses as legal, medical or crisis advice.

7. AVYUHA SaaS - Product Overview

AVYUHA SaaS is a configurable digital-business platform for micro and small enterprises in India and global markets.

Business problem

Many small businesses rely on social media, spreadsheets and messaging apps but lack an affordable unified system for websites, catalogues, customers and daily operations.

Solution

AVYUHA SaaS provides each business with its own workspace, brand settings, catalogue and dashboard while sharing one secure software foundation.

Business type	Possible use
Cafe or restaurant	Menu, offers, orders, location and owner dashboard.
Boutique or store	Product catalogue, enquiry form and customer leads.
Service business	Service packages, booking requests and customer follow-up.
Local seller	Simple storefront, product images and WhatsApp enquiry links.

8. AVYUHA SaaS - Major Modules

Major product modules

Module	Details
Business onboarding	Register business name, owner details, category, location and brand preferences.
Storefront builder	Template-based website or catalogue with custom sections.
Product management	Add, edit, delete and organize products or services.
Customer enquiries	Collect messages, leads, order requests and service questions.
Owner dashboard	Business owner can manage content without editing code.
Analytics	Track visits, enquiries, top products and customer interest.
Domain support	Use platform subdomain first, then connect custom domain later.

Practice note

For RAG practice, users can ask module-specific questions such as which module handles product editing or which module supports custom domains.

9. AVYUHA SaaS - Dummy Pricing Plans

The following plans are fictional and only created for RAG practice. They are not official pricing.

Plan	Target user	Features	Dummy price
Starter	Very small shops	Basic storefront, 20 products, enquiry form	INR 499 per month
Growth	Growing local businesses	100 products, owner dashboard, analytics, custom theme	INR 999 per month
Pro	Multi-location businesses	Multiple staff accounts, advanced analytics, connected domain	INR 1999 per month
Global	International sellers	Multi-currency display, region pages, priority setup	USD 49 per month

Important RAG rule

If a user asks whether these are real prices, the assistant must say they are fictional dummy prices for practice only.

10. Technical Architecture for AVYUHA RAG Practice

The AVYUHA RAG projects use a simple but expandable architecture.

Naive RAG architecture

PDF text is extracted, split into chunks, embedded, stored in ChromaDB, retrieved by similarity search and sent to the LLM for grounded answer generation.

Hybrid RAG architecture

Hybrid RAG combines dense vector retrieval with keyword retrieval. It can improve results when users ask exact-name, number, email, plan or role questions.

Agentic RAG architecture

Agentic RAG uses an agent workflow. The agent can decide whether to retrieve, rewrite the question, grade retrieved context, retrieve again or produce a final answer.

RAG type	New technology added
Naive RAG	Dense embeddings, vector search and grounded prompt.
Hybrid RAG	BM25 keyword retrieval, result merging and optional reranking.
Agentic RAG	Tools, state graph, conditional routing and retrieval decisions.
Multimodal RAG	Vision model, OCR, image extraction and image-aware retrieval.

11. Team, Roles and Dummy Contacts

The following team details are included to test exact retrieval, people questions and citation behavior.

Person	Practice responsibility
Sujith	Frontend and interface development for MutualDreamers.
Sai Charan Reddy	AI engineering learning, RAG implementation, GitHub and deployment.
Varshitha	Community safety ideas and user content flow.
Shivani	Product communication, content organization and testing support.

Dummy contact details

Entity	Email	Phone
AVYUHA	contact.avyuha@example.com	+91 00000 00000
MutualDreamers	mutualdreamers.avyuha@example.com	+91 00000 00001
Random Confession	randomconfession.avyuha@example.com	+91 00000 00002
AVYUHA SaaS	saas.avyuha@example.com	+91 00000 00003

12. AVYUHA Policies for Responsible AI

Grounded answer policy

An AVYUHA RAG assistant must answer only from the supplied context. If the retrieved context does not contain the answer, it must say that the information was not found in the AVYUHA knowledge base.

No-assumption rule

The assistant must not guess missing product features, real company status, real pricing, real contact details, legal claims, medical claims or psychological diagnosis.

Citation rule

Every factual answer should cite the supporting PDF page. If multiple pages support the answer, the answer can mention multiple page numbers.

Sensitive content rule

For dreams, confessions or emotional topics, AI-generated responses must be framed as general reflection or product information, not professional advice.

13. RAG Answer Rules and Refusal Cases

Answer rules

- Use only the retrieved AVYUHA context.
- Do not use outside knowledge.
- Do not invent or assume details.
- Cite the source page.
- Keep the answer clear and concise.
- If information is missing, say: I could not find this information in the AVYUHA knowledge base.

Example unavailable questions

Question	Expected behavior
What is AVYUHA's real registered company number?	Refuse because it is not provided.
What is the real phone number of Sujith?	Refuse because only dummy product contacts are provided.
Is MutualDreamers approved by a medical board?	Refuse because no such approval exists in this document.
What is the exact launch date?	Refuse because no exact launch date is provided.

14. Practice Questions and Evaluation Dataset

This page contains sample questions for testing retrieval quality, answer grounding and refusal behavior.

Question	Answer should be found?
What is the parent brand role of AVYUHA?	Yes
Why does MutualDreamers exist?	Yes
Who are the developers mentioned for MutualDreamers?	Yes
What can people share on Random Confession?	Yes
Which AVYUHA SaaS plan includes connected domain?	Yes
What is the real GST number of AVYUHA?	No
Can the AI diagnose a user's dream?	No
Which module allows product editing?	Yes
What is the exact public launch date?	No

Evaluation idea

A good RAG test includes answerable questions and unanswerable questions. This proves the assistant can retrieve facts and refuse unsupported answers.

15. Multimodal RAG Practice Page

This page is designed for future multimodal RAG practice. It describes visual evidence that could later be converted into images, diagrams or screenshots.

Visual asset descriptions

Asset	Purpose
AVYUHA ecosystem diagram	Shows AVYUHA as parent brand connected to three products.
MutualDreamers dream-flow diagram	Shows user creating a dream, finding similar dreams and discussing safely.
Random Confession moderation flow	Shows confession submission, automated checks, reports and review.
SaaS owner dashboard mockup	Shows product management, enquiries, analytics and business settings.

Text workflow for future diagram

User question -> agent decides retrieval need -> search knowledge base -> grade context -> answer with citation or refuse.

Learning goal

In multimodal RAG, the system should understand not only text but also diagrams, screenshots, tables and page images. This page gives future visual targets for that upgrade.
